

More and more garbage in the bins

In the neighborhood where you live, there is a continuous deterioration of the situation related to household waste management. There is a steady trend towards a gradual increase in domestically generated garbage. As a result, the bins often overflow with all kinds of waste, and some of it is scattered on the streets, attracting domestic and wild animals. The stench of decomposing organic waste is especially irritating in summer.

What actions would you recommend being taken:

- The household waste disposal company must replace the old containers with larger ones. If necessary, especially in the summer, it should be consider more frequent garbage collection.
- The municipality should initiate separate collection of waste (glass, paper, plastic, metal), which will prevent household waste from mixing with these materials. For this purpose, containers will be needed for separate collection of waste, as well as a company responsible for their removal and recovery.
- Local eco-activists can initiate an information campaign promoting household waste separation and recycling.
- Students must present to their parents arguments defending taking action to reduce or reuse products, as well as recycle waste.
- Composting household waste is a lifesaver for all households that generate large amounts of organic waste.
- It is not difficult to get used to more or less garbage. And we can deal with the unpleasant smell on hot days by closing the windows tightly and turning on the air conditioner.
- The municipality should increase the fees for household waste, the amount of which is determined by the waste quantity. This measure will encourage households to throw away less waste.
- Something else.
